

**The Nervous system** 

# The Nervous System

- ➤ The nervous system is very important in helping to maintain the homeostasis (balance) of the human body.
- ➤ A series of sensory receptors work with the nervous system to provide information about changes in both the internal and external environments.
- ➤ The human nervous system is a complex of interconnected systems in which larger systems are comprised of smaller subsystems each of which have specific structures with specific functions.

### Structure and function

Neurons (nerve cells) are the basic elements of the nervous

#### **Neurons**

- ➤ Cell Body
  - ➤ The main processing center of the cell.
- > Dendrites
  - ➤ Thin branching extensions of the cell body that conduct nerve impulses *toward* the cell body.
- > Axon
  - ➤ A single branch (in most neurons) which conducts nerve impulses away from the cell body.
  - ➤ Myelin sheath and neurilemma are coverings.

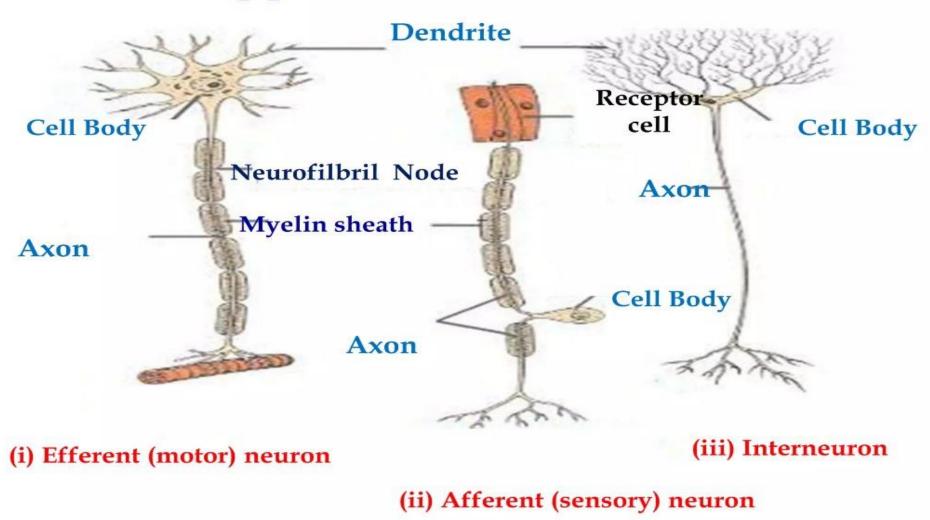

#### **Neurons**

- ➤ Impulse Transmission
  - ➤ Terminal end fibers are located at the ends of the axon and they transmit impulses leaving the neuron across a synapse to the next neuron.

# Three Types of Neurons

- Efferent (motor)
  - Conveys information from the CNS to muscles and glands.
- ➤ Afferent (sensory)
  - ➤ Carry information from sensory receptors to the CNS.
- > Interneuron
  - Carry and process sensory information.

# Types of Neurons

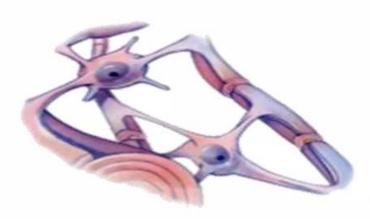

### Neuroglia

- Support, protect, connect and remove debris from the nervous system
- > Types of Neuroglial Cells

Astrocytes

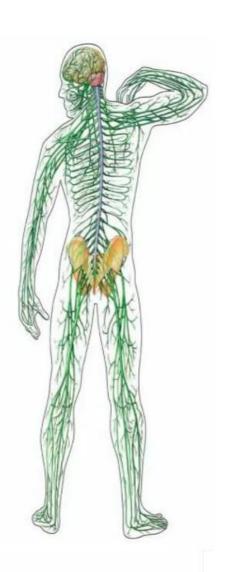

Oligodendroglia

Microglia

# Nervous System

- All bodily activities, voluntary and involuntary, are controlled by the nervous system.
- > Two Major Components
  - Central Nervous System (CNS)
    - Made up of the brain and spinal cord
  - Peripheral Nervous System (PNS)
    - Made up of all the nerves that lead into and out of the CNS.

## Central Nervous System

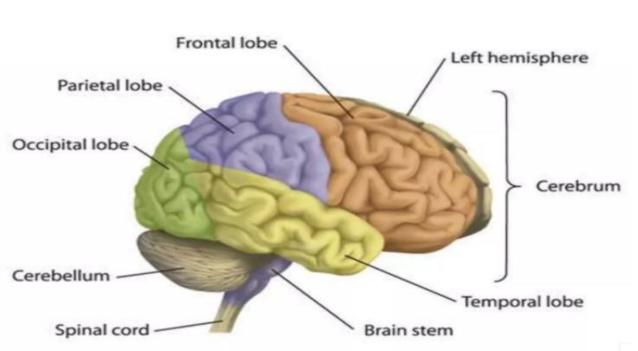

- ➤ The central nervous system is composed of two major interconnected organs:
  - The brain
  - The spinal cord.
- ➤ These organs work together to integrate and coordinate sensory and motor information for the purpose of controlling the various tissues, organs, and organ systems of the body.
- ➤ The central nervous system is responsible for higher neural functions, such as memory, learning, and emotion.

#### Brain

- ➤ Weighs about 3 pounds in adults
- > 75% water
- ≥ 20% of oxygen
- ➤ Contains over 100 billion neurons
- Controls bodily functions and interactions with the outside world

#### Four Parts:

- Cerebrum
- Diencephalons
- Brain stem
- □ Cerebellum

#### **Brainstem**

➤ Made up of the midbrain; Pons and the medulla oblongata.

Midbrain: Involved with visual reflexes

#### Pons:

- Located between the midbrain and the medulla oblongata
- Controls certain respiratory functions

#### Medulla Oblongata:

 Contains centers that regulate heart and lung functioning, swallowing, coughing, vomiting and sneezing

#### Cerebellum

Area that coordinates musculoskeletal movement to maintain posture, balance, and muscle tone.

➤Inferior to the occipital lobes of the cerebrum.

➤ Posterior to the pons and medulla oblongata .

#### Cerebrum

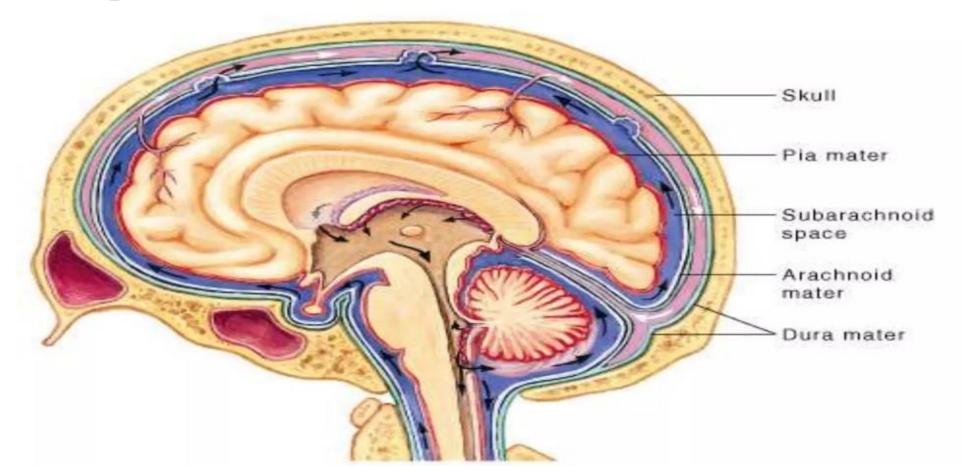

- Located above the cerebellum.
- ➤ Contains two hemispheres with an outer portion called the cerebral cortex.
- ➤ The two hemispheres are connected by a bridge of nerve fibers that relay information between the two hemispheres called the corpus callosum.
- ➤ The left and right lobes are each divided into four lobes or parts parietal lobe
  - Frontal lobe
  - Temporal lobe
  - Occipital lobe

#### **Diencephalon:** The deep portion of the brain containing:

- Thalamus
- Hypothalamus
- Epithalamus
- Ventral thalamus

### Serves as relay center for sensations like:

- ➤ Heart rate
- ➤ Blood pressure
- ➤ Temperature control
- ➤ Behavioral responses
- ➤ Digestive functions
- ➤ Water and electrolyte balance

### **Spinal Cord**

- ➤ Extends from the medulla oblongata of the brain to the area around the first lumbar vertebra in the lower back.
- ➤ Nerves from the peripheral nervous system extend out from the spinal cord.
- ➤ Protected by:
  - Vertebral column
    Cerebrospinal fluid
- Meninges
- ➤ Meninges are three layers of membranes that cover the brain and spinal cord.

### Layers of the meninges

- ➤ Dura mater
  - ➤ Outer tough fibrous membrane.
- ➤ Arachnoid mater
  - ➤ Middle weblike membrane containing CSF.
- ➤ Pia mater
  - ➤ Innermost layer containing several blood vessels.

# Peripheral Nervous System

- ➤ The peripheral nervous system (PNS) is a collection of **peripheral nerves**, **ganglia** and specialized sensory structures that, as a system, carries sensory and motor information between the central nervous system and all other organs and tissues of the body.
- ➤ The peripheral nervous system is functionally divided into two major divisions:
  - The Sensory or Afferent Division

The Motor or Efferent Division

- The Somatic Nervous System
- The Autonomic (Visceral) Nervous System.

-Spinal Cord

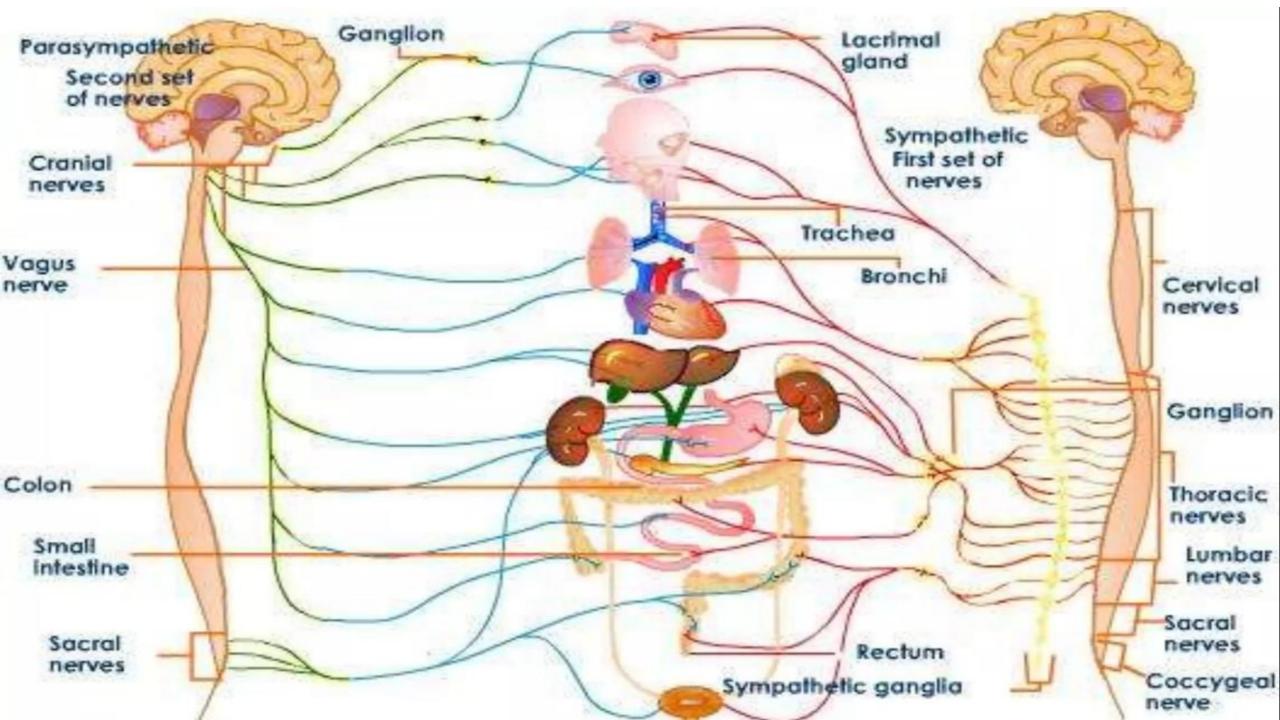

Peripheral nerves

### **Peripheral Nervous System**

➤ Consists of 12 pairs of cranial nerves and 31 pairs of spinal nerves

S. No	Cranial Nerves	Function
1	Olfactory	Sense of smell
2	Optic	Sense of vision
3	Oculomotor	Eye movements
4	Trochlear	Aids muscles that move the eyes
5	Trigeminal	Eyes, tear glands, scalp, forehead, teeth, gums, lips, and mouth muscles
6	Abducens	Muscle conditioning
7	Facial	Taste, facial expressions, tear and salivary glands

S. No	Cranial Nerves	Function
8	Vestibulocochlear	Hearing and equilibrium
9	Glossopharyngeal	Pharynx, tonsils tongue and carotid arteries; stimulates salivary glands
10	Vagus	Speech, swallowing, heart muscle, smooth muscle and certain glands
11	Accessory	Muscles of the soft palate, pharynx, larynx and neck
12	Hypoglossal	Tongue movement
